JOSHUA RICE

SENIOR FULL-STACK SOFTWARE ENGINEER | AI FORWARD-DEPLOYED ENGINEERING

Ardmore, OK | Remote | Open to relocation & travel | joshrice171723@gmail.com | linkedin.com/in/josh-rice-70b7b2215

PROFILE

Full-stack engineer with 4+ years of production experience translating complex healthcare workflows into reliable software. Early engineer at WeInfuse, working directly with a founder and former infusion-clinic owner to turn frontline operational needs into product decisions and deployed capabilities for a HIPAA-compliant healthcare product. Re-entered software through sustained exploration of AI in late 2024, progressing to hands-on agentic-systems development in 2025 and intensive independent building in 2026.

FORWARD-DEPLOYED STRENGTHS

Workflow-first delivery: Partner directly with product users and domain experts to observe real workflows, uncover pain points, and turn improvements into production software.

Healthcare software: Built and maintained capabilities for a HIPAA-compliant healthcare product.

End-to-end delivery: Frame ambiguous needs, build across the stack, debug production issues, and iterate with stakeholders.

Independent AI work (2025-present): Hands-on exploration of AI agents and workflows, including tool use, memory, context management, model routing, and token optimization.

PROFESSIONAL EXPERIENCE

Senior Full-Stack Software Developer | WeInfuse

Austin, TX | 2019 - 2022

- Joined WeInfuse in 2019 as its third software engineer; partnered daily with the CEO, a former infusion-clinic owner and primary product expert, to turn real clinic workflows into production software. During my tenure, the platform grew from 100+ infusion-center locations and 65,000+ treatments to 670+ locations and 1M+ completed appointments.
- Promoted to Senior as the engineering organization grew to roughly 15 engineers across three teams; interviewed and mentored developers.
- When I joined, WeInfuse did not yet support medication-inventory tracking, insurance billing, patient cost estimates, or treatment-profitability calculations. I independently built and maintained these core, client-facing production workflows through my departure as the platform grew to more than 670 locations and 1M completed appointments.
- Operated in an ambiguous, high-ownership environment: clarified workflows and constraints, proposed practical implementations, shipped features, and refined them from stakeholder feedback.
- Diagnosed production failures across Angular.js/React frontends, Rails backends, APIs, background jobs, and data flows; implemented durable fixes and coordinated resolution.
- Modernized legacy functionality through Angular.js-to-React migration and targeted refactoring.

Software Developer | CollectivePoint

Austin, TX | 2018 - 2019

- Developed insurance registration and estimation software for desktop and mobile users; reviewed code, investigated defects, and debugged behavior across the product stack.
- Worked across C#/.NET application code, SQL-backed data access, REST/API integrations, debugging, and testing.

Full-Time Family Caregiver |

Ardmore, OK | 2022 - June 2026

- Stepped away from full-time engineering to manage a critical, long-term family health crisis and estate logistics.

SELECTED AI SYSTEMS WORK

North Star - AI Command Center | Independent Project

Independent | 2026 - Present

- Engineered a user-triggered, five-source job-search pipeline across USAJOBS, Adzuna, Remotive, Dice, and Greenhouse that processes 500+ listings per search. A deterministic 0-100 pre-filter removes low-signal roles before OpenRouter-backed LLM evaluation, reducing token use by about 80% and ranking the top 20 roles against a supplied resume.
- Built an end-to-end application workflow that turns ranked roles into tracked opportunities, generates tailored resume and cover-letter drafts, and provides browser-assisted, review-before-fill application support with user approval before submission.
- Added Gmail and Google Voice ingestion to match recruiting activity to job records and automatically update the application pipeline; scraped Greenhouse-hosted roles for intake.
- Built an AI-powered voice interview simulator in Electron and React using the Web Audio and MediaRecorder APIs, OpenAI Whisper speech-to-text, Kokoro text-to-speech, OpenRouter LLMs, and Exa web search; grounded adaptive questions and rubric-based scoring in each role, resume, cover letter, and verified company research, then generated STAR coaching and weakness-targeted drills.

EDUCATION

Grayson County College | Business Administration

Austin Community College | Accelerated Programmer Training

TECHNICAL TOOLKIT

Architecture, Ownership & Delivery: Greenfield system architecture, system design, end-to-end product development, technical decision-making, cross-language development, rapid ramp-up in unfamiliar languages and codebases

AI & Agentic Systems: LLM agents, agent orchestration, tool calling, MCP servers & tools, structured outputs, retrieval/context workflows, context engineering, memory systems, model routing, token/context optimization, prompt engineering, LLM APIs, local and hosted LLMs, OpenRouter, OpenAI Whisper, Kokoro TTS, Exa web search, Ollama, Hugging Face

Languages: Ruby, JavaScript, Python, C#, SQL

Frameworks & Full-Stack Development: Ruby on Rails, Active Record, React, Electron, Angular.js, Node.js, .NET, Sidekiq, HTML/CSS, API-driven applications

APIs & Integrations: REST APIs, third-party API integration, OAuth, Web Audio API, MediaRecorder API, Gmail and Google Calendar integrations, job-board integrations, external data-source integrations

Data & Persistence: Relational databases, SQL Server, MySQL, PostgreSQL
